In 1995 SYSTAT was sold to SPSS Inc., who marketed the product to a scientific audience under the SPSS Science division. By 2002, SPSS had changed its focus to business analytics and decided to sell SYSTAT to Cranes Software in Bangalore, India. Cranes formed Systat Software, Inc. to market and distribute SYSTAT in the US, and a number of other divisions for global distribution. The headquarters are in Chicago, Illinois.

SYSTAT was also a command on the DEC TOPS-10 and RSTS/E computer operating systems by which one obtained the current general status of the running operating system. The commands showed the logged-on users, processes, I/O, and other interesting system management information. This command was parodied by the Firesign Theatre in their album I Think We're All Bozos on This Bus.

systat or Active Users is a simple Internet protocol ostensibly useful for "debugging and measurement".[1] A connection to port 11, by either TCP or UDP, elicits a list of users currently logged into the system. Though it remains an official Internet protocol, its use is considered a security vulnerability.[2]

This text provides detailed information on manipulating data, introducing SYSTAT 6.0 for Windows. This book provides instructions for those users who need more sophisticated data management functions. It addresses topics such as: entering data; importing and exporting data; and listing, printing and sorting data; selecting subsets of variables or cases; merging, transposing and unpacking files; and re-expressing and transforming data. The book also describes quick plots and quick statistics, and provides instruction for selecting cases, performing analysis by groups, and saving and printing output and graphics. In addition it provides information about the online help systems and command language. Also included are examples and technical information about the SYSTAT file structure.

This book summarizes the scripting language commands in SYSTAT 6.0 for Windows. The manual is divided into three sections. The common features and options section lists and defines such features as: importing files; merging files; printing and saving text results and graphical displays; listing data; transforming data; defining and labeling subgroups. This section also summarizes commands available in SYSTAT's BASIC programming language. Graphics, the second section, defines features and options for SYSTAT's graphical displays. The last section, Statistics, describes commands for statistical procedures, including ANOVA, cluster analysis, discriminate analysis, factor analysis, and general linear model.
